

G40 Seed Treater

Graham Seed Treating Systems has been designing and retailing seed treating systems in Canada and other parts of North America for well over a decade.

The G3 Treater is the most common treater and the G40 is based on the same time proven principles of the G3 Treater.

*G40 Package with M&T 240 HC
with optional bulk transfer.*

The G40 will treat wheat at 40 bu / minute and barley at 50 bu / minute.

All G40 packages come with our TX8E Transfer Auger. This 8" transfer auger has a built in seed flow control kit to regulate the grain flow to the treater and a 3hp 230v electric motor with a built in forward / reverse switch for easy cleanout between varieties.

The G40 applicator can also be rigid mounted to the bottom of a hopper bin for treating of delicate crops or when being used in a seed plant situation.

Units come fully calibrated to ensure that you apply the correct rate of chemical in a uniform manner to all your seed.

G40 Features

- Units can be configured with a 120L or 240L Mix & Treat supply unit.
- Units have a built in product transfer function. They can transfer product directly from bulk drums or totes to the product storage tanks.
- Units can be configured with optional double shoot insert to allow sequential product application without tank mixing products
- The MTS is capable of treating a full tandem load of seed (500 bu) in ten minutes.

The TX8E transfer auger also comes with high speed axles and a swing away hitch for road transport between locations.
